Human, Environment and Sustainable Development

Mohammad Hassan Ehrampoush

Department of Environmental Health, Shahid Sadoughi University of Medical Sciences, Yazd, Iran

Human is interacting with his/her environment that is human life acquires own benefit from natural resources and blessings of the environment. On the other, way of living affects on the environment. These interactions can be constructive or destructive. Unfortunately in many cases, way of living resulting in environmental destruction.

Unilateral attention to economic growth and inattention to sustainable development in many countries, often causing destruction of natural resources and excessive discharge of pollutants to the environment. So that every year, several reports about irreparable environmental damage causing by human activities is published.

Indiscriminate use of natural resources, unsafe disposal of waste, urban and industrial wastewaters and discharge of air pollutants to the environment, has disrupted ecological and environmental balance. That is in some cases above effects are caused groundwater levels drop, salt water intrusion, land summit, pollution of groundwater and surface water resources, sea pollution and air pollution in the global scale and correction of these damages is sometimes impossible and/or requires too much time.

For this reason, managers and the societies decision makers is necessary to be aware of environmental bitter events and should adopt multifunction strategic policies with their implementation prevent damage to the environment through useful strategies, increase the speed of reclamation and restoration of the nature and environmental.
