ABSTRACT

Introduction: Volunteering is a way for community participation and involving local social capital. Volunteering has the potential to enhance well-being and reduce health inequalities. The aim of this study was to evaluate the effects of online volunteering on people's well-being and the reduction of inequalities.

Methods: In this narrative review, using related keywords, 326 studies were found in the initial search in PubMed, Sage, Springer, Google Scholar, Elsevier, PsycINFO and finally 57 studies were selected for review.

Results: The study found that virtual volunteering in organizations is a combination of offline and online volunteering, and fewer volunteers are online volunteers. One of the main features of online volunteering is the maximum use of time, and the reduction of travel time. This type of volunteering can be done 24 hours a day and seven days a week. Online volunteering can involve all people, including young people, the elderly, people with disabilities and disadvantaged groups and minorities. One of the main benefits of this type of volunteering is that many people who cannot attend the organization can participate in this way. Online volunteering also could reduce the discrimination and health inequalities. .

Conclusion: Although online volunteering is developing globally, volunteer-based organizations have not yet adopted their strategies, rules, and procedures for new volunteers. It seems online volunteering will also enable different groups to participate in activities and promote the health of different groups.

Keywords: Online Volunteering, Volunteer Organizations, Online Advocacy, Health Inequality

Introduction

Today information technology plays an important role in modern life and as a tool to influence various aspects of human life. In the year 2017, the number of mobile phone users in the world was over 4.77 billion and is predicted to reach five billion people in 2019 ⁽¹⁾. In the year 2016, it was estimated that 62.9 percent of the people in the world have a cell phone. Also, until June of the year 2017, 51 percent of people around the world have accessed to the Internet ⁽²⁾. In the year 2015, the international communication Union reported that 3.2 billion people or half of the world's people would be online until the end of the year ⁽²⁾. Oxford dictionary has defined online as "any activity or service provided or available through the use of the Internet or any types of computer network ⁽²⁾."

There is strong evidence that volunteering and well-being have positive interaction. Participation in voluntary services has positive effects on mental health ^(3, 4), life satisfaction ^(5, 6), happiness ^(7, 8), self-esteem ^(7, 9), functional inability ^(9, 10) and psychosocial well-being⁽¹¹⁾. Voluntary activities in the world are expanding at different levels and with different objectives. With an overview of the voluntary literature, we can find five dimensions in the definitions of the voluntary activity. The first dimension is a free choice, which means that the volunteer participates freely and without compulsion in a particular activity ^(12, 13). Some definitions also describe volunteers as someone who has relative freedom and voluntary commitment ⁽¹⁴⁻¹⁶⁾. For example, some people who provide public services instead of military service can be considered volunteer.

The second dimension is about rewarding volunteers. Due to the definitions of volunteer, the volunteer will not receive a bonus. Broader definitions of the volunteer can include rewards, but they should not be expected to receive rewards. The broadest definition of the volunteer is the receipt of the reward for the cost performance ^(14, 17, 18).

In the third dimension, volunteers are defined according to their work structure. Two different

areas are separated. A weaker definition includes only voluntary activity in the formal organizational structure but the broader definition includes some activities such as helping a neighbor, helping friends, etc. ⁽¹⁹⁻²⁴⁾. The fourth dimension of volunteering is also about the beneficiary of volunteering. A weaker definition accepts only volunteering activities aimed at strangers but also accepts other definitions such as benefits to friends and relatives. In this dimension, and the broadest definition, volunteering services to volunteers themselves are also accepted ^(20, 23, 25-29). In the fifth dimension, the physical or virtual presence of the volunteer is discussed. Many studies have only addressed volunteers, while recent studies have considered online or distant volunteering as one of the main types of volunteering ^(13, 16, 27, 30-37). With the advent of information and communication technologies, volunteering goes from present and physical to both online and distance. In the traditional form of volunteering, each stage of it was done face to face, but today; the volunteer can choose an organization or take on a specific task and carry it out remotely through digital technology ^(14, 38-40). Many leaders believe that the use of information and communication technologies will also increase the efficiency of the management process of volunteers as well as the provision of volunteers such as ICT activists, the youth and travelers ⁽⁴⁶⁾. The aim of this study was to find different types of online volunteering, place and time of online volunteering, online volunteers attributes and advantages, disadvantages, opportunities and also the threats of online volunteering.

Methods

This study was conducted using a review method. The word combination of Table 1 was used to search. 326 articles were extracted using databases; PsycINFO, Elsevier, Springer, PubMed, Google Scholar and the combination of the keywords are mentioned. After reviewing the abstracts of the articles and examining their relationship with the research questions, 57 studies were selected. All the search were done in English. To combine the keywords, the same keywords

related to "volunteering" and "virtual" with the OR operator were placed in a set, and then two sets were combined with the AND operator. When an article with the above descriptions was found, the title and summary of the article were reviewed to

find out if the article was relevant to the main questions. In the case of ambiguity, the full text of the article was also examined to determine if there were any entry criteria.

Results

Different types of online volunteering:

Various terms are used to classify online volunteering. The United Nations defines online volunteering as "volunteering completely or at different stages, by volunteering through the Internet at home, at work, at a university, at an internet cafe or any other places possible" (35, 40). Also, in defining a virtual voluntary project, the term "virtual volunteer" refers to someone who "works at home or at work through the internet" (33).

Volunteers like Internet volunteers and distance volunteers are also said to have recently added a micro-volunteer term to this literature that refers to the use of mobile software and social networks (42). These concepts represent a variety of online volunteering concepts regarding scope. Lopez (43) has identified four categories of online volunteer participation that are called online advocacy, online assessment, consultancy, online-offline volunteers, and pure online volunteers.

Online advocacy: It is about social issues campaigns that use the Internet to promote policy change. In particular, the online platform has been used as a new tool for promoting political ideas (44). Some believe that increasing access to online activities (sometimes called "clicktivism") may lead to the emergence of a "digital protest tool" (40). **Online Assessment and Consultancy:** While some platforms contribute to nonprofit goals, others only provide room for collaboration. Online portals or associations allow individuals to get help and advice from people who have special expertise.

Online volunteers for offline projects: Offline volunteers may become online volunteers, and this happens when a person can do his job online.

Pure Online Volunteers: It's a full version of volunteering that happens on the Internet. By expanding the recruitment of online volunteers and the allocation of online responsibilities, as in the second and third types of online volunteering, online volunteers are ultimately more responsible than offline (37, 45).

With regard to the online volunteering site, four broad conclusions can be derived from virtual volunteering research (46). First, the demand for virtual volunteering as a means of finding work among those who are currently capable of volunteering is low. Second, the use of information and communication technology to reach a new source of volunteers looking for a way to participate in civil society is high. Third, most of the voluntary virtual businesses held in voluntary organizations include a mix of online and office work, and fourth, a pure online volunteering, in which people use ICT tools to find and do voluntary work alone, happens rarely. Internet invitations provide a new tool for organizations to recruit volunteers. The quality of work and trust in online volunteers is usually the same or higher than the quality achieved through traditional methods (47).

Online communities and discussion groups are the main online volunteers. Studies have shown that both implicit and explicit volunteers create social capital that is the key to the success of online societies. In a study by the Internet Chess Club, volunteers were identified as the core of the online club, which improved the features of the website software and also provided a critical role among the community's subsets (48).

The concept of time has a different form and

meaning in the field of online volunteering. As you can say, the area of the work the volunteers are doing is redefined. As mentioned above, one of the main features that distinguish online volunteers from their face to face counterparts is maximizing time which is considered a valuable asset. Online group volunteering easily provides team members' relationships, thus maximizing the use of limited time for active participants is possible here. Regular meetings require a lot of logistical coordination because both parties must be physically present at one time and one place, while Internet messages can be sent by email and participants can read and write messages in comfortable conditions⁽³¹⁾. Also, volunteering on the Internet is an interesting and alternative way for the people who have limited time but want to help others.

An online volunteer from Brazil, translating diverse research on street children in Latin America from Spanish to Portuguese describes his online volunteering effort. He said "Online volunteering opened my eyes to a lot of small donations from a citizen that an ordinary person like myself can do in my spare time." In some cases, it may also be advisable to hold face to face meetings, if possible, or by telephone to help maintain virtual volunteering⁽⁴⁹⁾.

Online volunteering eliminates the time spent on traveling and provides timely service to customer. Transfer of knowledge is a field that greatly benefits from the elimination of time and space barriers. Today, online volunteers communicate with trainees or specialists in remote areas via the Internet. An example is CUSO International, which employs virtual volunteers from all over the world to work with other countries such as El Salvador, Guatemala, Honduras, Nigeria, Ethiopia, Cambodia, and Indonesia. Online volunteering provides services 24 hours a day and seven days a week. An example is the Emergency Line to help Sexual Harassment Victims, an innovative model using volunteers to provide critical services through an online telephone line.

Volunteers and users can have better participation using the 24- hours online services,

which eliminated the geographical barriers⁽⁴⁴⁾. It is well noted that time is the most valuable asset. For this reason, online volunteering, electronic counseling, and voluntary electronic activities have left the future to busy professionals^(17,31).

Volunteering enables online individuals to work voluntarily wherever they have computers, and for those who have less physical and physiological limitations and personal obligations, more opportunities for voluntary work is provided^(33, 47). While female volunteers are usually active in voluntary organizations⁽⁵⁰⁾, the percentage of male volunteers in online volunteering studies, especially among those who have good communication with technology, is significant. For example, in an environment that has an applied computing activity, such as the Malaria Control Center, more than 80% of volunteers work online⁽⁵¹⁾.

Virtual volunteering also varies in age, education, and employment status. Compared to traditional volunteers, virtual volunteers in Canada are usually young, educated and unemployed⁽⁴⁷⁾.

Most online volunteers are in their 20s or 30s. They often operate in projects such as virtual voluntary projects^(33, 51). And thus online volunteers are younger than traditional volunteers. Some academics believe older people are usually passive consumers of information technology and avoid the unknown technologies of the Internet⁽¹⁵⁾. Others regard the physical distance between the volunteer and the venue of volunteering as a major obstacle and are therefore optimistic about the online participation of the elderly⁽¹⁸⁾. While some volunteers may be involved with online volunteering because of virtual Internet space, many people experience a combination of face to face and online volunteering.

However, the elderly face various barriers regarding online volunteering, such as the complexity of the website, small font size and poor skill⁽⁵²⁾. In traditional volunteering, creativeness for volunteering directly relates to the volunteer's experience of friends and family as well as their own previous experience. People whose parents have volunteering experience are

more likely to become a volunteer⁽⁵³⁾. There is a similar tendency for online volunteering. In a study, many people who volunteered for an online organization had a volunteer in their family or friends⁽¹⁴⁾. Also, in a study, many elderly volunteers reported to being acquainted with online volunteering through their grandchildren⁽¹⁸⁾. Online volunteers may be completely new⁽⁴⁷⁾.

Online volunteering incentives vary from one area to another, but altruism is one of the main motivations. For focused projects, volunteers are primarily involved for a particular cause and for a desire for solidarity or socialization⁽⁵¹⁾. Wikipedia volunteer directors and editors mainly work for learning motives, but at the same time, they want to create a wealth of knowledge for the general public. On the other hand, gaining social credibility or gaining credibility in online communities has often been of top motivations⁽³²⁾.

Some research has proposed a distinction between the motivational goals between volunteers in software area and volunteers in the content area. While content is always motivated by philanthropy, software contributors place more emphasis on gaining their reputation and empowerment⁽⁵⁴⁾. When they showed that they were unique in their work, they went through challenging goals to demonstrate their ability better⁽⁵⁵⁾. Therefore, sometimes using the social reward technique, based on uniqueness and challengingly, manages and increases volunteers' activity⁽⁵⁶⁾. Also, people looking for an online job seek online volunteering with the aim of finding an earning job⁽⁴⁷⁾.

Discussion

Comparison of online volunteering and face to face volunteering

Online volunteers spend more time on volunteering than face to face volunteers, as they may be volunteering through the Internet rather than face to face. The number of online volunteers is also higher than face to face volunteers. On the other hand, online volunteers have less volunteering experience than face to

face volunteers. However, factors such as the quality of work and the reliability of online volunteers is at a higher level than face to face volunteers⁽⁴⁷⁾. While altruism is the dominant motivation of all volunteers, this motivation is more powerful in online volunteers since selfish behaviors, including psychological and social motivations are less common among online volunteers⁽⁵⁷⁾.

Reasons for wanting to wear a uniform, socializing with celebrities, enjoying travel opportunities and maintaining health and fitness, which may motivate volunteers to work face to face is no longer relevant to virtual volunteers. Online volunteers in-service programs are usually eager to learn and make changes⁽⁴¹⁾. Therefore, it is emphasized in the literature that approvals for volunteering, such as issuing a certificate after completing tasks and providing feedback to online volunteers, are very important^(14, 33). While a lot of research has been done on the impact of face to face volunteering on volunteers^(34, 53, 58), almost none of the effects of online volunteering has been identified.

The lack of social and emotional communication of virtual volunteers with others, including those receiving volunteering services, limits these effects to online volunteers. Similarly, unlike face to face volunteering, the voluntary effect of online services on recipients, non-profit organizations⁽⁵⁹⁾, online membership moderator organizations⁽⁶⁰⁾, and local community and society⁽³⁶⁾ has not been studied properly.

Choosing online volunteers is usually done by organizations after receiving requests through the website. Organizations may invite volunteers through their site or other sites. However, it's a common practice to recruit volunteers based on information and qualification of volunteers. Monitoring online volunteers may be done by employees of the organization or by specialized staff in HRM. However, previous studies have shown that organizations that have appointed a person to manage volunteers, including online volunteers, are usually more successful in managing them⁽³³⁾. However, some voluntary

human resource managers are more successful in recruiting online volunteers⁽⁴⁷⁾. However, keeping volunteers is harder than recruiting them, because online tasks are mainly based on just one task. Some organizations have expressed concern about doing their job on existing websites. Organizations often complain that many online volunteers do not respond to emails sent for follow-ups or simply disappear, or respond after posting their programs or performing their duties⁽³⁸⁾.

Advantages and disadvantages of online volunteering

Online Volunteering has many advantages over face to face volunteering. This approach "allows individuals to do volunteering work through a computer at home or at work, which is not influenced by time constraints, personal priorities, disabilities, or family obligations, which prevent them from volunteering."⁽³³⁾ The elderly and people with disabilities, those who have been victims of bias in a volunteer environment can now volunteer online. On the other hand, online volunteering has special benefits for nonprofit and voluntary organizations. Performing relatively inexpensive work is known as the primary reason for many organizations to engage in online volunteers^(14, 33). However, there are always costs of employment, training, and supervision.

However, virtual volunteering has also disadvantages. The main problem is the withdrawal of virtual volunteers after the organization spends the time to accept, train, and manage online volunteers⁽³⁸⁾. Sometimes an online volunteer wants to get more jobs from the organization. In volunteering for international activities, organizations expect volunteers to spend more time learning and doing their job. These disadvantages of online volunteering are commonplace with the volunteers and are not limited to this type of volunteering⁽¹⁵⁾.

Challenges and Sustainability of Online volunteering

Online volunteering is still a new concept between volunteer oriented organizations and managers, and so there are a lot of things to do

about it. It's a question that new and emerging technologies can put people who are not interested in volunteering into an online volunteering process. Research has shown that major volunteers are also active in face to face volunteering⁽⁴⁷⁾.

Catherine Ackerman⁽¹³⁾, examined the social, demographic, resources, and psychological characteristics of online and face to face volunteers and found that online volunteering can be a way of eliminating inequalities in social participation. And in a society that is increasingly digitizing, it can bring social participation from the physical environment to the virtual environment.

Conclusion

Several general conclusions can be drawn from this study on online volunteering. First, online volunteering promises volunteers to reach a new source to look for a way to participate in citizenship. Second, most of the virtual volunteering activities conducted in volunteering organizations include a combination of online and face to face volunteering. One of the main features of online volunteering is the maximum use of time, and the reduction of travel time as this type of volunteering can be done 24 hours a day and seven days a week. Online volunteering can involve all people, including young people, the elderly, people with disabilities and disadvantaged groups and minorities. One of the main benefits of this type of volunteering is that many people who cannot attend the organization can participate and in this way, volunteer services will be provided, and the racial and ethnic discrimination in this type of volunteering can be reduced. Although online volunteering is developing globally, volunteer-based organizations have not yet adopted their strategies, rules, and procedures for the new volunteers. It seems online volunteering will enable different groups to participate in activities and can also promote the health of different groups.
